Walter Blombach GmbH

## Tool and Machine Factory based in Remscheid and Neuerburg

D-42871 Remscheid - Postfach 120161 - Phone.: (02191) 597-0 - Fax: (02191) 597-40<br>D-54673 Neuerburg - WABECO Str. 1-10 - Phone.: (06564) 9697-0 - Fax: (06564) 9697

We hereby declare that the universal milling and drilling machines specified below
Universal Lathes Typ:
D2000E - D2400 E - D3000 E
meet the following regulation requirements for standard serie production

- EC directive for machines EWG 91/68 and 89/392
- EC low voltage directive 73/23/EWG

In order to meet / implement the requirements of the above mentioned directives, the following applicable and previously published standards have been adhered to:

EN 292-1
EN 292-2
EN292-2 Enclosure I
EN 294
EN 349
EN 418
EN 60204

## Outlay

## Dear customer!

Congratulations on choosing the WABECO Universal Lathe. We have taken great care in its manufacture and we have given it a thorough quality control test. These operating instructions are to help you to work with it safely and properly.
After unpacking the machine please check to see if any kind of damage has occurred during transportation. Any complaints must be made immediately. Complaints made at a later date cannot be accepted.

If you have any questions or need any spare parts, please quote the machine number located on the front of the motor.

Wir können Ihnen wahlweise unsere Bedienungsanleitungen und Prospekte in englischer und französischer Sprache kostenlos zusenden.

We are able to send you free of charge our Operating Instructions and leaflets in French and/or English translation.

Nous avons la possibilité de vous donner nos Instructions de Service et prospectus aussi en traduction francaise et/ou anglaise, sans frais.

## 1. Technical Data

### 1.1 Universal Lathe D2000 E

| Working range |  |
| :--- | :--- | :--- |
| Centre distance ...................................................... | 350 mm |
| Centre height.......................................................... | 110 mm |

Work spindle
Drive output............................................................. 1,4 kW, 230 V, 50 Hz
Infinetely variable spindle speed .............................. 45 - 2300 r.p.m.
Spindle bore
20 mm optional 30 mm
Cone in spindle nose
Cone 3 - only for spindle bore 20 mm

## Cross table

diameter of chuck work, measured above the cross table.......................................................................... 126 mm
cross table range of displacement............................. 110 mm
turning carriage's range of displacement ................... 58 mm
swivel-feature of the upper slide rest......................... $360^{\circ}$
Height of turning tools max........................................ 20 mm
Guideways
Longitudinal support ................................................. ground guiding bars
Cross support................................................................. adjustable dovetail guide
Stripping rings ............................................................. protection of the guides
Length of guides............................................................ 575 mm
Width of guides.............................................................. 130 mm
diameter of chuck work, measured above the guiding
bars .............................................................................. 220 mm
Tail stock
Tail spindle's range of displacement............................ 65 mm
Tail spindle's hole bore ................................................ cone2
lateral displacement of the tailstock to both sides ........ $\pm 10 \mathrm{~mm}$
Advance
Automatic advance...................................................... 0,085mm/r.p.m. optional 0,16
Screw cutting attachment - optional

- metric thread .......................................................... 0,4-3,0 mm
- inch thread ............................................................ 10-32 thread per inch

Noise values according DIN 45635 - part 1
Emission data:
no-load running
LpA $=63 \mathrm{~dB}(\mathrm{~A})$
load running
LpA $=67 \mathrm{~dB}(\mathrm{~A})$

- Subject to technical alterations -

## 1. Technical Data

### 1.2 Universal Lathe D2400 E

Working range
Centre distance ..... 500 mm
Centre height ..... 110 mm
Work spindle
Main drive electronic adjustable motor
Drive output ..... 1,4 Kw, 230V, 50 Hz
Infinetely variable spindle speed ..... 45-2300 r.p.m.
Spindle bore 20 mm optional 30 mm
Cone in spindle nose CM3 - only for spindle bore 20 mm
Cross table
diameter of chuck work, measured above the crosstable.126 mm
cross table range of displacement ..... 110 mm
turning carriage's range of displacement ..... 58 mm
swivel-feature of the upper slide rest ..... $360^{\circ}$
Height of turning tools max ..... 20 mm
Guideways
Longitudinal support ground guiding bars
Cross support adjustable dovetail guide
Stripping rings protection of the guides
Length of guides ..... 740 mm
Width of guides ..... 130 mm
$\varnothing$ of guides ..... 30 mm
diameter of chuck work, measured above the guiding ..... 220 mm
bars
Tailstock
Tail spindle's range of displacement ..... 65 mm
Tail spindle's hole bore ..... cone2
lateral displacement of the tailstock to both sides ..... $\pm 10 \mathrm{~mm}$
Advance
Automatic advance $0,085 \mathrm{~mm} /$ r.p.m. Optional 0,16
Screw-cutting attachment Optional

- metric thread ..... 0,4-3,0 mm
- inch thread 10-32 thread per inch
Noise values according DIN 45635 - part 1
Emission data:
no-load running ..... $\mathrm{LpA}=63 \mathrm{~dB}(\mathrm{~A})$load running

$$
\mathrm{LpA}=67 \mathrm{~dB}(\mathrm{~A})
$$

## 1. Technical Data

### 1.3 Universal Lathe D3000 E

Working range
Centre distance ..... 500 mm
Centre height ..... 110 mm
Work spindle
Main drive electronic adjustable motor
Drive output ..... $1,4 \mathrm{Kw}, 230 \mathrm{~V}, 50 \mathrm{~Hz}$
Infinetely variable spindle speed ..... 45-2300 r.p.m.
Spindle bore 20 mm Optional 30 mm
Cone in spindle nose CM3 - only for spindel bore 20 mm
Advance
Automatic advance ..... 0-250
Cross table
diameter of chuck work, measured above the cross
table. 126 mm
cross table range of displacement ..... 100 mm
turning carriage's range of displacement ..... 58 mm
swivel-feature of the upper slide rest. ..... $360^{\circ}$
Height of turning tools max. ..... 20 mm
Guideways
Longitudinal support ground guiding bars
Cross support adjustable dovetail guide
Stripping rings protection of the guides
Length of guides ..... 740 mm
Width of guides ..... 130 mm
$\varnothing$ of guides ..... 30 mm
diameter of chuck work, measured above the guiding bars ..... 220 mm
Tailstock
Tail spindle's range of displacement ..... 65 mm
Tail spindle's hole bore ..... cone2
lateral displacement of the tailstock to both sides ..... $\pm 10 \mathrm{~mm}$
Advance
Automatic advance $0-250 \mathrm{~mm} / \mathrm{min}$
Screw cutting attachment
metric thread ..... 0,4-3,0 mm
inch thread ..... 10-32 thread per inch
Noise values according DIN 45635 - part 1
Emission data:
no-load running$\mathrm{LpA}=63 \mathrm{~dB}(\mathrm{~A})$load running

## 2. Drawings and list of parts

3. Block circuit diagram
3.1 for D2000 E, D2400 E

3. Block circuit diagram
3.2 for D3000 E

## 4. Delivery and installation

The lathes are carefully packed in our factory.

## Please check the following on delivery:

1. whether the packaging has been damaged and/or:
2. whether the lathes shows signs of transport damage or if there are grounds for complaint. In this case we request your immediate notification. Claims made at a later date cannot be acknowledged.

The lathe must be installed on an appropriate, level and firm base.

This would be, for example:

- a base cabinet such as in our accessories programme
- own work bench as long as it is strong enough to carry the weight of the machine without warping (see technical data and check with spirit level) and has an even surface.
- a steel plate

The lathe must be firmly screwed down onto the base. To facilitate this, there are 9 mm holes in the machine base. Good results and a minimum of vibration during operation can only be guaranteed if the above mentioned requirements for secure mounting have been kept to.

The installation of the machine should take place where there is sufficient lighting, electrical cables with earthed sockets and O-conductors are installed adequately near to the machine so that the mains connection lead is not subject to any tension whatsoever. The mains lead should be such that, by means of a multiple socket, a coolant or lubrication unit can also be connected.

## 5. Starting-up and maintenance

Fix the machine on a sturdy, level support
Use sharp processing tools
Adjust speed setting and feed to fit the material and diameter of the tool
Clamp the tools so that the clamping position is as near possible to the workpiece
Clamp the workpieces fast and without vibrations.
Long pces. support with tailstock or with fixed stay.
Apply coolant and lubricant for better surface quality (finish) and dimensional accuracy
Fix processing tools and workpieces on clean clamping surfaces Grease the machine sufficiently

Use the correct tools for removing the material from the workpieces
Set correct bearing clearances and align guides early enough

## 6. Overload protection

Wait approx. 1 second after switching off the machine manually or after an automatic switchdown following an overload before you switch on again. This will ensure that the motor is protected effectively in all work situations. Otherwise it is possible that the machine will not come on because the relay for the electronics has not been able to function.

## 7. Safety Instructions

1. The feed line for the motor may only be connected to a shock-proof socket or junction box. (Have the socket or junction box checked by an electrician beforehand; protection against children being able to put into operation).
The socket or junction box must be close enough to the equipment, that the current-carrying cable is subjected to no tensile strain whatsoever.
2. The three-phase A.C. motor must be connected by an electrician over a protective switch of 1 ampere to the 380 V mains supply.
3. When maintenance or cleaning work is being done, the machine must be shutdown and the mains plug pulled out.
4. Do not brake workpieces or chuck by hand or any other objects.
5. Wear safety goggles when working the machine.
6. Do not remove the chips with the hand. Use corresponding aids (hand brush, hook, paint brush).
7. Always keep the protective hood on the driving mechanism closed.
8. The turning tools must be firmly tightened at the correct height and as short as possible.
9. The turning tools must never be exchanged when the machine is running.
10. Never leave the clamping chuck key in (even when not in operation).
11. Observe the bearing distance of the turning chuck. (Turning jaws max. $40 \mathrm{~mm} \varnothing$, Drilling jaws max. $100 \mathrm{~mm} \varnothing$ ).
12. Never take measurements on work pieces being turned (danger of accidents and damage to the measuring gauges)
13. Do not wear loose items of clothing (ties, shirt sleeves, jewellery etc.).
14. When working between centres, always centre well in order to avoid a flying-out of the workpiece. In addition, check the tightening screw of the tailstock to make sure it is tight.
15. When working with automatic advance take care that the cross table does not touch the chuck or the tailstock.
16. Never leave the machine when in operation.
17. When turning wood, use the lathe centre fort he slaving of the work piece instead of the lathe chuck.
18. The machine must be secured so that it cannot be swichted on by children. Make sure that other people do not come in contact with the machine.
19. The machine must be kept dry at all times.
20. Check the machine frequently for damage. Any damage parts must be replaced with original parts and should be fitted by an expert or by us.

## 8. Startup and Maintenance

### 8.1 Electrical equipment

The lathes are fitted with a master switch with undervoltage release, i.e. this switch must be switched on before the machine can be switched on via the reserving switch. The master switch must also be switched on again following a power failure.

ON - OFF lever for automatic feed

- All lathes can only switched on with closed plexiglass bonnet.

If you want to change the turning direction through the switch right-left the switch must stay for 1 sec. on 0-position for the reason that the relay of the potentiometer has enough time to react.

### 8.2 Start up

- 

Prior its putting into operation the machine must once more be cleaned with great care. All lubricating points have to be furnished with grease while the cross slide, the threaded spindles, the guide bars and the quill are thoroughly oiled.
Turn by hand all spindles in order to check for their smooth turning.
Run in the lathe with the lowest possible rotary speed being switched on. A full load to start with must be avoided!

### 8.3 Maintenance

The longtime serviceability is vitally dependent upon a corresponding serving attendance. The lathe needs to be cleaned after every turning job.

In case the lathe is being erected within a moist cellar, all naked parts need to be oiled after completed usage to avoid corrision.

An overall and constant lubrication of all moving parts is highly signeficant. In case backlash within the bearings or within the guideways of the slides should occur, readjust in time to avoid the bearing or the guideways of the slides being destroyed.

Prior to every putting into operation all lubricating points of the lathe must receive a grease for roller bearings having commercial quality.

Both guiding bars have to be greased, too, preceding every putting into operation. The two dovetail guides of the cross slide, the threaded spindles of the cross slide accessible from below, the feed rod as well as the tailstock quill have to be greased at intervals of 100 service tours each using lubricating oil.

When greasing make sure to put the slide of the cross slide to its hindmost position while extending the tailstock quill to its foremost posision. Greasing the tailstock spindle is performed via the hollow borehole within the quill.

apply grease prior to

### 8.5 Initial cleaning of the machine

Prior to putting the machine into operation for the first time all maked parts have to be cleaned applying petroleum or gasoline used for cleaning, because these parts have been treated with slushing oil before leaving the factory.

### 8.6 Spindle head

The spindle head is firmly attached to the slide bars. In the spindle head, the work spindle is run on two adjustable precision tapered roller bearings.

## Should a readjustment of the bearings be neccessary, please proceed in the following manner:

1. Loosen the locking screw in the adjustment nut. The adjustment nut is located at the rear end of the work spindle.
2. Turn the adjustment nut in a clockwise direction until the bearings again run free of play (the work spindle being easily able to be turned by hand).
3. Tighten the locking screw again.

■
Roller bearing adjusted too tightly become useless after a short period

## Automatic feed:

Likewise, the is an on-off lever for the automatic forward feed on the front side of the spindle head. When supplied the wheels for the forward feed $0.085 \mathrm{~mm} / \mathrm{rev}$. are attached.

### 8.7 Compound rest

The compound rest consists of a longitudinal and a transverse slide rest. Its dovetail guides are ajustable.

### 8.7 Compound rest

## Should a readjustment be necessary, please proceed in the following manner:

1. Counter nuts must be loosened.
2. By using a socket head wrench, tighten the readjustment screws until the carriage can just be turned to and from by means of the crank.
3. adjustment tighten the counter nuts again.

## Longitudinal slide:

The longitudinal slide rest is mounted on the transverse slide rest and can be pivoted through $360^{\circ}$ degrees. Thus, it is suitable for the turning of tapers. For adjustment, the 4 mm Allen key is used to loosen the two screws located on the outer sides of the transverse slide rest. The arrow on the transverse slide rest. There is a scale of the degrees on the longitudinal slide rest. The distance between two graduation marks represents one degree.

## Scale rings:

To set the turning tools, the slide rest spindles have graduation collars with graduation marks. One graduation mark represents a 0.05 mm feed adjustment which corresponds to a 0.1 mm chip removal on the work piece.
The hexagon socket screw is provided for cases where the compound rest is to be fixed to the slide bars (e.g. in the case of transverse turning.) It screws down the clamped piece at the lower side of the transverse slide rest against the two slide bars.

### 8.8 Tailstock

The tailstock is attached to the slide bars in such a way that it is slidable. It can be easily tightened in any position by screwing the lower T-handle (4251). It can be separated into barrel and base. By loosening the spanner bolt (424), the tailstock barrel can be pushed to either side by up to 10 mm and is, therefore, suitable for the turning of slight tapers. After completing the taper work, the tailstock is to be returned to its original position.
The central position of the tailstock is indicated by the mark on the side. By making a trial turning operation establish whether the working piece is cylindrical and if necessary correct the position of the tailstock.

## Solid tailstock sleeve:

The solid tailstock sleeve, which is provided with a millimetre scale, is designed in such a way that the lathe centre, drill barrel or chuck are automatically ejected when turning back.

## Tool clamping:

An inner cone MT 2 which is worked into the tailstock sleeve serves to accept the tools. By screwing the upper T-handle (4251), the tailstock sleeve can easily be clamped in any position. The tailstock sleeve can be moved axialy over a threaded spindle by using the crank (31212) located at the rear end.

T-handle (4251) for tightening the tailstock
spanner bolt (424)

## 9. Speed regulation

### 9.1 Speed selection

The spindle speed is to be selected according to the type of material and the diameter of the work piece:

| Small diameter | $\Rightarrow \quad$ relatively high speed |
| :--- | :--- | :--- |
| Large diameter | $\Rightarrow$ low speed |

The cutting speed is the result of speed and diameter.

With a known and required cutting speed, the necessary spindle speed can be calculated in the following way:

> cutting speed $(\mathrm{V}) \times 1000$
> diameter of workpiece $(\mathrm{d}) \times 3,14$

Example: An aluminium workpiece which has a diameter of 20 mm is to be turned with a cutting speed of $100 \mathrm{~m} / \mathrm{min}$.

$$
\frac{100 \times 1.000}{20 \times 3,14}=\frac{100.000}{62,8}=1592^{1} / \mathrm{min}
$$

Now, from those speeds available, the one is selected which is nearest to the ideal speed of $15921 / \mathrm{min}$. (in our case $16001 / \mathrm{min}$.).

### 9.1.1 Speed Setting for Working with Aluminium

workpiece- $\varnothing$ approx. r.p.m. cutting speed m/min

| 10 mm | 2300 | 75 |
| :--- | :---: | :---: |
| 20 mm | 1600 | 100 |
| 40 mm | 800 | 100 |
| 60 mm | 530 | 100 |
| 80 mm | 400 | 100 |
| 100 mm | 320 | 100 |

### 9.1.2 Speed setting for working with steel

workpiece- $\varnothing$ approx. r.p.m. cutting speed $\mathrm{m} / \mathrm{min}$

| 10 mm | 1600 | 50 |
| :--- | :---: | :--- |
| 20 mm | 800 | 50 |
| 40 mm | 400 | 50 |
| 60 mm | 270 | 50 |
| 80 mm | 200 | 50 |
| 100 mm | 160 | 50 |

9.1.3 Speed Setting for Working with Brass, Copper

| 10 mm | 2300 | 80 |
| :---: | :---: | :---: |
| 20 mm | 1270 | 80 |
| 40 mm | 640 | 80 |
| 60 mm | 425 | 80 |
| 80 mm | 320 | 80 |
| 100 mm | 250 | 80 |

### 9.2 Changing of speed

Rotational speed 45-2300 min $^{-1}$ :
The rotational speed of the work spindle can be infiniely varied between 45 and 400 rpm in the 1. Step or in the 2. Step between 200-2300 rpm. using the potentiometer on the front of the machine.

| speed setting at the <br> potentiometer | 1. step r.p.m. | 2. step r.p.m. |
| :---: | :---: | :---: |
| 10 | 45 | 200 |
| 20 | 105 | 350 |
| 30 | 175 | 740 |
| 40 | 260 | 1050 |
| 50 | 325 | 1440 |
| 60 | 360 | 1650 |
| 70 | 400 | 1860 |
| 80 | 460 | 2120 |
| 90 | 490 | 2160 |
| 100 | 500 | 2300 |

## Rotational speed 45-400 rpm:

The drive belt must be relocated if the lower speed stage with a minimum speed of 45 rpm is required.

## Proceed as follows:

Remove the protective cover and release the drive belt by unscrewing the clamping nut and turning the star handle clockwise until the drive belt can be relocated. Then re-tighten the drive belt in the reverse sequence of steps.

### 10.1 Longitudinal and transverse turning

## Longitudinal turning:

In the case of longitudinal turning tool moves parallel to the axis of the workpiece. For roughing at longitudinal turning the use of either a straight or arcuated turning tool is favourably.

## Transverse turning:

The tooling of the face is known as transverse turning. In the case of transverse turning, the turning tool is moved at 90 degrees to the turning axis of the piece being turned. In so doing the compound rest is to be locked. The main cutting edge of the turning tool is to be exactly centred so that no scar remains in the middle of the workpiece. The arcuated tool is used for transverse turning.

to 1+2: Roughing tools arcuated to the left and or right: By using them a maximum on material is to be cut off in as short a time as possible (without paying attention to the finish on the surface of the work piece). They can be used for longitudinal and transverse turning.
to 3: Offset side turning tool: Used for smoothing (clean surface) in the case of longitudinal and transverse turning.
to 4: Outside thread turning tool: Used for cutting of outside threads.
to 5: Narrow square-nose cutting tool: Used for the cutting of grooves and slicing of workpieces.

## ■

When inserting the slicing tool No. 5, pay careful attention to the exactness of the centre height of the turning tool. Work with low speed and cool the tool (use soluble oil or emulsion for cooling: serves to lubricate and for the removal of chips.) The slicing tool is to be clamped as short as possible and at $90^{\circ}$ degrees to the workpiece.
to 6: Right side tool: Used for the hollowing-out of boreholes. Clamp as short as possible in order to avoid ascillations of the turning tool which might otherwise occur (uneven surface).

### 10.1 Longitudinal and transverse turning

## $\square$

For the reason of the power at the turning chisel take care that the tool is short and fast fixed. If the lever arm is to long the turning chisel curves and springs back. The cutting part enters uneven into the workpiece and is producing a waved surface.
Take care that the turning chisel is placed on the middle of the turning piece. The control of the height position of the middle of the workpiece is done with the live lathe center in the tailstock.
For the regulation of the height position of the turning chisel use with straight sheet steel pieces.

### 10.2 Thread cutting and automatic feed

### 10.2.1 General note

The tread turning chisel is a form turning chisel with the profile of the thread to be cut.. It is ground according to jigs (diagram 1) and must be adjusted exactly to the middle of the workpiece as, otherwise, the profile of the thread would be distorted.

In order to obrain the correct position of the flanks of the thread to the axis of the workpiece, the grinding jig is put against the work piece and the turning tool is adjusted in accordance with it (diagram 1). For this purpose the jig is pushed successively on to both flanks of the turning tool. The feed of the thread turning tool is effected over the lead screw and must correspond to the thread pitch.

## Change gears:

The connection between the feed gear mechanism and the lead screw is made by the translating gear wheels (extras at D2000, D2000E and D2400) included in the attachments. By setting various combinations of gears it is possible to cut a metric right-hand thread with a pitch of $0,4 \mathrm{~mm}-3 \mathrm{~mm}$ and an inch-system right-hand thread with a pitch of 10Z/1" - 32 Z/1" (see table). (For left hand threads see the section "Gear pair, left-hand thread"). The various distances of the axes between the gears can be adjusted by swiveling the quadrant and readjusting the quadrant bolts.

## Feed:

The feed is switched on by means of the T-handle on the front side of the spindle head.

## Long thread:

In the case of long thread diameters, the revolving lathe centre should always be used in order to prevent the work piece from being pushed away.

## Overload clutch:

To avoid damage at the advance system the main spindle and the leading spindle drive are connected with an overload clutch.

### 10.2.2 Application of change gears - optional for D2000 and D2400 E

For the purpose of automatic longitudinal turning there are two feed rates, being at your disposal: $0,085 \mathrm{~mm}$ and $0,16 \mathrm{~mm} /$ revolution. (Upon delivery, the gears producing a feed of 0,085 $\mathrm{mm} /$ revolution have been put on).

Putting on different combinations of gears enables you to cut metric thread ranging from 0,4 to 3,0 mm in pitch. The same applies to inch thread ranging from 10 threads/" to 32 threads/" in pitch.

Table on thread cutting

|  | mm | 0,4 | 0,5 | 0,7 | 0,75 | 0,8 | 1,0 | 1,25 | 1,5 | 1,75 | 2,0 | 2,5 | 3,0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | A | 48 | 48 | 48 | 48 | 48 | 48 | 48 | 48 | 48 | 48 | 48 | 48 |
|  | B | 16 | 20 | 14 | 18 | 16 | 14 | 20 | 36 | 28 | 40 | 40 | 48 |
|  | C | 40 | 40 | 20 | 24 | 20 | 14 | 16 | 24 | 16 | 20 | 16 | 16 |
|  | Z/1" | 10 | 11 | 12 | 13 | 14 | 16 | 18 | 19 | 20 | 24 | 28 | 32 |
|  | A | 34 | 34 | 34 | 34 | 34 | 34 | 34 | 34 | 34 | 34 | 34 | 34 |
|  | B | 36 | 36 | 36 | 36 | 36 | 36 | 14 | 34* | 18 | 24 | 18 | 18 |
|  | C | 20 | 22 | 24 | 26* | 28 | 32 | 14 | 36 | 20 | 32 | 28 | 32 |

Table automatic longitudinal feed for D2000 - D2400 E
促

### 10.2.3 Altering the feeds or thread pitches <br> for D2000 E, D2400 E

## When altering the feeds or thread pitches, proceed as follows:

## 1. Changing the feed from $0,085 \mathrm{~mm}$ to $0,16 \mathrm{~mm}$

a. Loosen the fixing screw $D$ of the change gear quadrant.
b. Loosen and remove the hexagonal nuts and washers from the bolts $A$ and $B$.
c. Loosen the hexagonal bolts $A$ and $B$. Remove the toothed belt connecting $A$ and $B$. Unscrew the bolt $B$ together with the 2 tooth belt pulleys from the quadrant and remove it by slightly tilting upwards the bolt. This at the same time leaves free the toothed belt connecting the main spindle with $A$ by placing the toothed belt onto the great driving pulley $E$.
d. Remove both tooth belt pulleys Z 14 from their bolts A and B and change them for tooth belt pulley Z 18 or tooth belt pulley Z 20, respectively. Then, tighten bolt A. Mount and tighten the washers and nuts of $A$ and $B$.
e. Mount bolt $B$, together with both tooth belt pulleys into the change gear quadrant again by slightly tilting the bolt and screwing it into the square nut located behind the quadrant. Put on the toothed belt connecting $B$ and $C$, pull bolt $B$ upwards imparting tension to the toothed belt. Then, tighten bolt B.
f. Put on toothed belt from main spindle to bolt $A$ and from bolt $A$ to bolt $B$. Then tense the belt between main spindle and bolt $A$ by means of the change gear quadrant and tighten the change gear quadrant with fixing screw $D$.
g. Close the cover of the headstock and tighten again the screw with hexagonal recessed hole.

### 10.2.3 Altering the feeds or thread pitches for D2000 E, D2400 E

2. Changing the feed from $\mathbf{0 , 0 8 5} \mathrm{mm}$ to a metric pitch of $1,5 \mathrm{~mm}$
a. - c. Start the procedure exactly as already described under pos. 1, a-c, expect for the hexagonal nut being removed as well from the shearing bushing $C$, as described under pos. 1 b .
d. Pull off the bushing and the tooth belt Z 48 from the shearing bushing C. Put the bushing and the tooth belt pulley Z 24 onto the shearing bushing but, make sure that the bushing precedes the tooth belt pulley. Bolt $B$ with toothed belt will not be needed with thread cutting!
e. Pull off tooth belt pulley Z 14 from bolt $A$ and put on tooth belt pulley $Z 36$. Put on toothed belt connecting the main spindle with bolt $A$ and from $A$ to $C$.
f. - g. Proceed as described under pos. 1, f-g!

Only the two short toothed belts (1145) are required for cutting metric threads. The slightely longer toothed belt (1146), which connects the main spindle with wheel A The toothed belt (1145) connects wheel B with wheel C.
3. Changing the feed from $\mathbf{0 , 0 8 5} \mathbf{~ m m}$ to thread pitch $\mathbf{1 2}$ threads/"

Proceed exactly as already described under pos. 2. The procedure differs merely in additionally changing the tooth belt pulley $Z 48$ running on bolt $A$ for the tooth belt pulley $Z 34$.

As when cutting metric threads, only the two shorter toothed belts (1145) are normally required. Exeption: For a lead of 13. 14. 16 or 19 threads/inch. In this case, the longer toothed belt (1146) is required to connect wheels $A$ and $C$.

### 10.2.4 Changing of feeds or thread pitch for D3000 E

## 1. Working with the automatic longitudinal feed

a. Turn the handle (19) on the symbol longitudinal turning. For the connection of the clutch disk turn with with the handle (31212) a little.
b. Switch-on the direction switch on the right of the substructure.
middle position $=$ off
left injected $=$ advance to the spindle
right injected $=$ advance to the tailstock
With the potentiometer adjust the feed speed.
c. After the automatic longitudinal turning but the direction switch on the middle position.

## 2. Working with the thread cutting unit

a At first for the desired thread pitch the changing wheels must be mounted. Your receive the machine from our factory with yet mounted wheels $Z 36$ and $Z 24$ for a thread pitch of 1,5 mm. During putting of metric threads the toothed wheel $Z 48$ is placed on the change gear quadrant as shown on the picture 6.22. During cutting of inch thread this wheel has to be replaced through the tooth wheel Z 34 .
For the different thread pitches only the tooth wheels $B$ (beside $Z 48$ ) and $C$ ( on the main spindle) according to picture 6.22 have to been changed.
b. Select slowest spindle feed.
c. Turn the handle (19) on the symbol thread turning. The handle must be in function till the thread is ready produced. For the cutting of several cuts to produce the thread the machine must be stopped with the reversing switch at the end of the thread and at the same time the threadcutting tool separated. Now turn the reversing switch on left turning and the carriage runs in the direction of the tailstock. If the threadcutting tool is placed approx. 5 mm in front of the beginning of the thread, stop again the machine, turn the cross-slide ahead like the before made cut plus the desired removal of material. Then turn the reversing switch on right turning and execute the cutting of the thread. Only when the thread is finished the handle (19) can be put out again.

## 11. Pair of toothed wheels for left-hand thread

To cut left-hand threads, the toothed belt gear No. 11214 on bolt A is to be exchanged for the toothed gear Z 75 and the toothed belt gear No. 1114 on the work spindle exchanged for the toothed gear Z 50 .

To do this, proceed in the following manner:
a. Pull out the mains plug, loosen the hexagon socket screw at the front side of the headstock and open the cover. Remove the belt from the workspindle.
b. Loosen the screw $D$ of the quadrant. Loosen bolt $A$ and $B$ on the quadrant and remove toothed belt.
c. Remove bolt $A$ on the quadrant upwards and bolt $B$ on the quadrant downwards.
d. Loosen nut and washer from bolt A and remove. Loosen toothed belt gear No. 114114 and No. 11214 from bolt A and remove.
e Loosen the headless pin on the adjustment nut No. 1111 on the workspindle. Loosen the adjustment nut and remove from the workspindle.
f. Remove the V-belt pulley No. 1112, the separator bush No. 1113 and the toothed belt gear No. 1114 from the workspindle. Mount the toothed belt from the workspindle and tighten firmly with the adjustment nut.
g. Mount toothed gear Z 75 and the toothed belt pulley No. 114114 on to the bolt A and tighten with the washer and the hexagon nut.
h. Mount toothed gear Z 50, separator bush No. 1113 and V-belt pulley No. 1112 on to the workspindle and tighten with the adjustment nut.
i. Pay attention to the correct adjustment of the tapered roller bearings see section"headstock"
j. Lay the toothed belt from A to B, cam in the toothed gear $Z 75$ with $Z 50$ by swivelling the quadrant, tighten the screw $D$. Tense the toothed belt from $A$ to $B$ through removing $B$.
k. Lay the drive belt on the workspindle and tense. Close the cover and tighten with the hexagon socket screw at the headstock.

## 12. Angle plate with milling table

## for drilling and milling

The milling is used to produce flat surfaces and grooves. When milling the advance and feed motion are effected with the angle plate from the workpiece. If the angle plate is correctly mounted on the compound rest (see assembly instructions), the workpiece can be rigidly and firmly attached to the clamping plate. This should be cleaned of dirt and chips beforehand in order to guarantee a good rest. The clamping screws used are inserted into the T-groove of the clamping plate. In addition, a machine vice can be attached to the clamping plate. The tool is to be clamped as short as possible in the collet chuck (danger of breaking). If
 the tool is firmly clamped, the depth adjustment can be made over the feed shaft.

## Assembly of the angle plate with the milling table

At first you remove the longitudinal slide rest from the transversal slide rest of the lathe. Then the angle is screwed on to the carriage of the transversal slide rest with the delivered hexagon screw. After removing the clamping plate and the spring from the longitudinal slide rest you fix the longitudinal slide rest as indicated against the clamping angle.

## 13. Three jaw-chuck and four jaw-chuck

## The three-jaw chuck

serves to clamp circular, triangular and hexagonal workpieces centrically to the spindle axis.

## The four-jaw chuck

serves to clamp square workpieces centrically to the spindle axis.

## Danger of accident

Do not try to clamp larger workpieces. The chucking power is then too low and the jaws can detach themselves.

## Mounting of turning jaws:

The jaws and guides are numbered from 1-3. Open the chuck by means of the chuck key until the jaws loosen. (order: 3, 2,1 bzw. 4, 3, 2, 1).
Now, take the inner jaws beginning with the number 1 and put this in the guide number 1 . Push the jaw number 1 in the direction of the centre point of the chuck and at the same time turn the chuck key (direction "tighten"). When the transverse spiral has taken hold of number 1, number 2 must be put in the guide provided. The same now happens to number 2 as to number 1. Proceed with number 3 and number 4 in the same way. Subsequently, examine the position of the jaws.

## Mounting of drilling jaws:

If, afterwards, you again want to work with outer jaws, the process repeats itself in the same order (first jaw 1, then 2, then 3 , then 4 ).

## 14. Collet chuck

## Mounting of the tool holder:

When working with the collet chuck, the concentric chuck must be removed from the workspindle. In order to do this, loosen the three tightening screws by means of the Allan key SW6 included in the accessories. Now, the chuck can beremoved from the concentric flange of the workspindle and the collet chuck can be fixed in the same way as the lathe chuck.

## Collets:

Then press the collet into the union nut and screw it on the collet chuck.
15. Steady and follow rest

## Steady and follow rest compensate for the deflection of long shafts caused by resultant cutting forces. The roller jaws of the rests prevent the pieces to be turned form deflection.

They are to be adjusted in such a manner that the turning axis of the workpiece is in true alignment with the height of the centres of the machine. At the point of support, the pieces to be turned must be completely round.

## Steady rest:

The steady rest can be firmly clamped to any position on the slide bars. It is put on the slide bars with its half shells and fixed to the slide bars by means of the clamping plate.

## Follow rest:

The follow rest is used particularly for turning thin, long shafts and for turning threaded spindles. It is screwed firmly on to the threaded drilled holes of the compound rest provided for this purpose, so that it holds the workpiece as near as possible to the turning tool.

## 16. Square turret head

The square turret head is used instead of the clamping plate in order to clamp the tools.

Four turning tools can be changed simultaneously. By swivelling the turret head by 90 degrees each time, the required turning tool can quickly be brought into its working position

There are four centering holes on the bottom for securing the square turret head in its four positions. For this purpose, the screw supplied with the springmounted steel ball must first be screwed into the threaded hole in the upper part of the turning carriage.

## 17. Hand tool rest for turning wood

## Die Handstahlauflage wird auf die Führungsstangen der Drehmaschine montiert.

There are two alternative adjustments:

1. By loosening the lower part by means of the knurled screw, the hand tool rest can be adjusted to any position or be swivelled to the workpiece.

2. By loosening the upper part by means of the
3. knurled screw, it can be centred or by corresponding turning adapted to match the shape of the workpiece.

To avoid accidents during operating with chisels on the hand steel rest and the

$\square$fixing of the workpiece into the chuck please use for wood turning the fix lathe centre.
To avoid accidents, the hand tool rest is to be pushed as near as possible to the workpiece and readjusted in the course of machining.
18. Wood turning lathe centre

The wood turning centre serves to accept workpieces out of wood between the centres and enables a machining of the piece throughout its entire length without any reclamping being necessary.

It is contained in the inner taper of the workspindle. Pay carful attention to cleanliness when inserting the wood turning lathe centre since dirt or metal chips could damage the taper. By feeding forward the tailstock sleeve to the workpiece and the
 cutting edges of the turning lathe centre are pushed into the front side of the workpiece. The correct degree of pressure depends upon the firmness of the workpiece, the diameter and the cutting section (chisel advance).
